

Forge Assistant — Contributor Quick Start

You collect **screenshots of battle badges** from your own Forge worlds. The app only **looks** at your game — it **never clicks or plays**. Job: capture frames, press number keys to label them, upload. You can be collecting in **under 30 minutes**.

Already set up for you: **Windows 11, Python 3.11+, Git, Google Chrome**. One thing to confirm: ask Radek to **add you as a collaborator** so your uploads are accepted.

Step 1 · Get the project (one time)

Press `Win`, type **Git Bash**, open it, paste this one line (right-click pastes), press Enter:

```
git clone -b claudie/browser-automation-architecture-5784h1 https://github.com/Dirtystar/foe.git
```

It lands in your user folder (e.g. `C:\Users\YourName\foe`). Open it, then go into this sub-folder — the **Marek** folder is your home base:

```
foe > browser_automation_platform > Marek
```

Everything else is double-clicking the numbered files in the `Marek` folder, in order. No more typing. If Windows shows a blue "protected your PC" box, click **More info** → **Run anyway** — these are local helper scripts.

Step 2 · Install (one time)

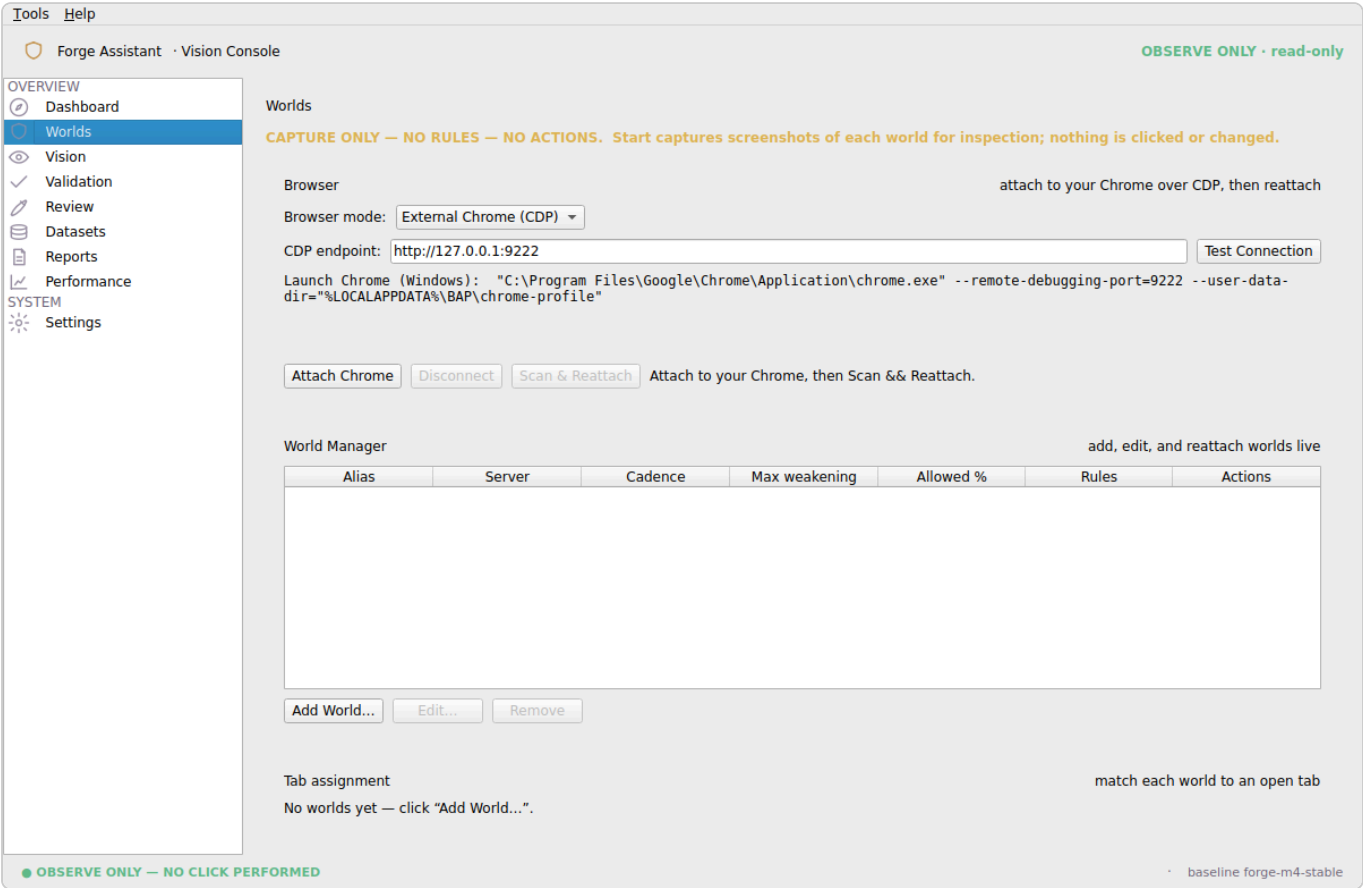

Double-click `1 - Install.bat`. It builds a private workspace and downloads libraries (2–4 min the first time). Wait for **"Install finished successfully."** You never repeat this unless asked.

Step 3 · Each session — three double-clicks, in order

Double-click	What happens
2 - Update.bat	Gets the latest version. Wait for "You are on the latest version."
3 - Start Chrome.bat	Opens a dedicated Chrome. Log into Forge and open your World tabs here. Your normal Chrome is untouched.
4 - Run.bat	Opens the Forge Assistant app.

The app always shows **OBSERVE ONLY — NO CLICK PERFORMED**. That banner is your guarantee: watching, not playing.

First run only — point the app at your Chrome. Click **Worlds** on the left. Set **Browser mode** → **External Chrome (CDP)**. It says "Restart BAP" — that's expected: **close the app, double-click `4 - Run.bat` again.** Now click **Test Connection** (turns green) → **Attach Chrome** → **Scan && Reattach**. Configured once; remembered forever.

The Worlds page after choosing "External Chrome (CDP)" and restarting — Test Connection, Attach Chrome, then Scan && Reattach.

Step 4 · Collect data

Open [Tools ▶ Live Data Collection...](#) — your workbench:

Session **20260806_103342** · mode **external_chrome** · **84** captured · **0** dup skipped · commit **dccbd19a**
Today's session · Worlds 8 · captured **84** · skipped 0 · reviewed 84 · pending 0 · duplicates 0 · rate 14.0/h · duration 6h 0m

▶ Start Session

Validate Dataset

Prepare Dataset Commit

Write Session Report

Refresh (F5)

Validate / Prepare Commit / Report results appear here.

Capture activity log.

Start Session, then Capture All Worlds. Captured frames appear in the list; the top line tracks your totals.

1. Click **Start Session**.
2. Click **Capture All Worlds** (or `Ctrl + Enter`). It screenshots every world in the background; the window stays responsive.
3. **Move around the battle map** in Chrome so new badges appear, then capture again. Repeat through the day.
- Grab **rare** badges whenever you see them: **red 80% badges are the most valuable**, then 40% and 100%.

Step 5 · Review — tell it which badge is which

Pick a row → **Open in Review** (or double-click it). For each badge box in the picture:

Key	Meaning	Key	Meaning
<code>1 2 3 4 5</code>	badge is 20 / 40 / 60 / 80 / 100 %	<code>N</code>	whole frame has no badges (clean map)
<code>Delete</code>	this box is not a badge — remove it	<code>Enter</code>	Save & next frame
<code>← →</code>	previous / next frame		

A green **REVIEWED** pill confirms the save. **Not sure of a number? Skip it** — blank is always safe. That's the whole job: capture, then press number keys.

Step 6 · Validate & upload

1. Click **Validate Dataset**. It only *reports* — if it lists problems, tell Radek; it never breaks anything.
2. **Close the app**.
3. Double-click `5 - Push.bat`. It uploads only your new data. The **first** upload opens a GitHub sign-in in your browser — do it once, it's remembered. Wait for **"Your data is uploaded. Thank you!"**

The whole loop: **2 - Update** → **3 - Start Chrome** → **4 - Run** → **collect** → **review** → **validate** → **5 - Push**.

If something looks wrong

You see...	Do this
<code>1 - Install.bat</code> : "Python was not found"	Reinstall Python from python.org, tick "Add python.exe to PATH" , run <code>1 - Install.bat</code> again.

3 - Start Chrome.bat : "Could not find Google Chrome"	Chrome is in an unusual place — message Radek.
Test Connection stays red	Make sure you opened Chrome with 3 - Start Chrome.bat (not your normal Chrome) and it's still open.
Worlds won't attach	In that dedicated Chrome, be logged into Forge with world tabs open, then Scan && Reattach .
5 - Push.bat : "Nothing new to send"	Capture/review some frames first, then push.
5 - Push.bat : "Upload failed"	Check internet, run 5 - Push.bat again — your work is saved locally, nothing is lost.
App won't open / red text	Screenshot the black window, send to Radek. Nothing is harmed.

The app is strictly read-only: no clicking, no cursor movement, no automation. The worst case is a frame you're unsure about — and "skip it" is always the right answer. You cannot break the game or the project.
